

AETHYX

Principal Pitch Script

A speaker-ready script for a three-person team

A simple, high-conviction pitch for an under-four-minute presentation

RUN OF SHOW

1	Hook and introduction	0:25
2	Problem	0:30
3	Solution	0:40
4	Demonstration	0:35
5	Business	0:35
6	Ask and close	0:35

Target length: approximately 3 minutes 20 seconds at a confident, conversational pace.

1. THE HOOK AND INTRODUCTION | 0:25

CEO/CTO

Good morning. Every time we ask an AI a question, we often send the same instructions, files, tool details, and conversation history again. We are effectively paying to make AI reread information it already has. We are Aethyx, and we are building an Indian AI platform designed to help AI understand more while processing less. Our goal is simple: make AI more efficient, affordable, and useful for long conversations and large documents.

PRESENTING POINTS

- Open with confidence and pause after the first two sentences.
- Make eye contact with the principal, not the screen.
- Say Aethyx clearly and finish with the one-line goal.

2. THE PROBLEM | 0:30

CMO

Today's AI systems face a major hidden problem. Coding assistants repeatedly process entire software projects. Document assistants repeatedly receive the same reports and policies. Business assistants repeatedly resend long histories and instructions. That creates three costs: higher operating expenses, slower responses, and more private information being transmitted repeatedly. As AI products grow, this problem grows with them. The industry is focused on building bigger models. We are focusing on making the information reaching those models more efficient.

PRESENTING POINTS

- Use the three examples quickly; do not explain the technology behind them.
- Count the three costs on your fingers.
- End with the contrast: bigger models versus smarter information.

3. THE SOLUTION | 0:40

CEO/CTO

Aethyx introduces a preparation layer between the user and the AI. Before information is sent, our system organizes it locally, removes repetition, preserves important facts, and sends only what is useful for the current question. The model is then trained to understand this more compact format. This can potentially reduce unnecessary input, lower cost, improve speed, support longer useful memory, and reduce repeated data transfer. We are testing text, structured, graph-based, and other compressed formats to discover what works best.

PRESENTING POINTS

- Use a simple hand motion: information enters, gets prepared, then gets sent.
- Say 'can potentially' - the research is promising but still in development.
- Keep the explanation conceptual; avoid terms such as tokens or transformers.

4. THE DEMONSTRATION | 0:35

CEO/CTO

We already have an early result. In a 600-case test, our context-preparation system used 63% less model input and transferred 64% less data, while retaining the important sources and key facts in the test. This is still research, not a final commercial guarantee. Alongside that system, we have built our own 137.6-million-parameter language model from scratch. Our next target is a 1-billion-parameter model trained on English, Indian languages, general knowledge, mathematics, and programming.

PRESENTING POINTS

- If a visual demo is available, show the full input beside the prepared input.
- Point to 63% and 64% only once; do not overload the audience with numbers.
- Say the caveat confidently - it increases credibility.

5. THE BUSINESS | 0:35

CMO

We are currently in the development stage, but the business model is clear. Aethyx can be offered through API access for developers, paid plans for AI applications, enterprise licensing, and custom context-compression systems for companies with expensive long-context workloads. Our customers would pay for lower AI costs, better performance, and more efficient handling of documents, code, and conversations. Our first markets are coding tools, document assistants, multilingual applications, and business automation.

PRESENTING POINTS

- Be direct: this is a development-stage company, not a product claiming current revenue.
- Frame the customer benefit as savings and performance.
- Name only the four business routes; do not elaborate unless asked.

6. THE ASK AND CLOSE | 0:35

CIO, then CEO/CTO

CIO: We are seeking INR 1,00,000 to complete the next development stage. The funding will support cloud training, high-quality data, model testing, and the first 1-billion-parameter training runs.

CEO/CTO: We have identified a real problem, built the foundation, and produced an encouraging early result. Now we need the resources to prove the complete system in a live demonstration. The future of AI is not only about building bigger models. It is about building AI that can do more with less. We are Aethyx, and we are building that future from India. Thank you.

PRESENTING POINTS

- The CIO states the amount and stops. Let the number land.
- The CEO/CTO delivers the final line slowly.
- After 'Thank you,' remain silent and let the principal respond.

TEAM HANDOFFS

CEO/CTO	CMO	CIO
Owns the vision, model progress, demonstration, and final close.	Owns the problem, target users, and business model.	Owns the funding use and delivers the ask.

FACT CHECK FOR SPEAKERS

The 63% and 64% figures come from an early 600-case test. Say that answer-quality and final-cost testing is continuing. Aethyx is in development; the current model is approximately 137.6M parameters and the 1B model is the next target.
